

What is a disk image?

It is a copy of the data that you put on the file after you have created it.

What is the command to make a disk image?

This is the command: `dd if=/dev/zero bs=1M count=4000 >> diskimage.img`

What is a disk partition?

It is a hard disk partition that has defined storage space on a hard drive

How many disk partitions are in a disk image?

This usually depends on the copy that you want

What difficulties does this pose if any?

The file size can be the most difficult thing since the computer can only store so much data

What steps must you take to work with this?

You must first make sure that the file size is not really big but at the same time make sure that the file is not small as well.
